PREFACE

“The Gardener’s Colour Book” first came to my attention through a notice in the *London Times* Literary Supplement. Its name was irresistible; when the book arrived from London I found that so too, and it then occurred to me to suggest to Mr. Knopf the possibility of its counterpart for America. On his and Mr. Fothergill’s falling in with the idea the following pages resulted. It is really not my book — it is a translation only.

Very difficult it has been to decide upon the American seed-list to use in such a chart as this. Six or seven have been considered with the final settling upon Vaughan’s catalogue whose numbering of their seed-packets they tell me will be the same for some years to come. In all my gardening years I have had the most friendly and satisfactory relations with this well-established firm and I like to think of their surprise and pleasure when they see this book for the first time.

Almost all of the plants or seeds named here I have either used or seen; as for those which have not come under my eye I trust to the fine reputation of Vaughan and Company and to certain sources long used and found good in reading. The nomenclature is rather haphazard — sometimes botanical, sometimes not. “Standardized Plant Names” has been followed in the main. As I happen not to like the word “antirrhinum” — I like it neither in sight nor in sound — I have departed from English usage here and used snapdragon instead.

As for using the book, which may be said to apply more nearly to the latitude of Boston than to any other, make the time one week later for the latitude of New York, adding one more week for that of Philadelphia. Mr. Fothergill wonders — and so do I — at my temerity in attempting such a chart as this for America. The reassuring fact is that there are now hundreds and thousands of good gardeners all over the country who may easily adapt to their own uses in their own regions the suggestions in these columns. And when such gardeners shall have added in the many spaces

especially left for their notes the colours of flowers and their times of bloom in, for example, the Pacific Northwest or in the Middle South, why then from this book of Mr. Fothergill's and from my own overbold undertaking there will come various volumes on garden colour accurate and charming in their suggestion for parts of America, poles apart in climate and in soil.

LOUISA YEOMANS KING

INTRODUCTION

IN A GARDEN one patch of colour, beautifully or strikingly composed, avails more than an acre of beautiful flowers thrown into it without intention. The patch would have all the attraction of a picture, the acre of flowers would be merely like a palette after a day's work, a waste of colour. Nature, it is true, jumbles her colours together, but a garden is not a field or mountain side, it is an artificial thing or rather a work of art; and a gardener, by throwing together his colours anyhow has done no more than a cat does walking along the keys of the piano, or if one empties part of a furniture shop into one's drawing room.

The old-fashioned scheme of lobelia calceolaria and geraniums may offend us now but at least it was a scheme and few people make any attempt to replace it. Yet often we do conceive a combination of colours or find it in, say, an oriental embroidery, but, because the flowers to do it with come not readily to mind we drop it and resort to old clichés or nothing, or, worse, a "Blue Garden." As a device for making my small garden appear longer than it is, I cut a tapering path diagonally through it and it struck me that I could help out the appearance of distance given by the narrowing by planting it with flowers whose colours would give it also an atmospherical perspective, viz., beginning with hot and ending with cold colours, yellow, orange, red, purple, dark and pale blue and pink. But getting the plants to do it with, their proper colours, heights, and season of blooming required so much thinking that I found it best in the end to tabulate some 900 of the showy and more usual flowering plants and finding the tabulation indispensable, I thought it might be useful to others.

For long enough the painter has had his paint-box, the musician his keyboard and the embroiderer his heap of skeins and now for the first time he who would paint his garden has a palette of all the materials available tabulated in seasoned order. I thank my friend, Mr. Gilbert Pullen, a learned gardener, for his generous help to me in making up this colour book.

And now, Mrs. Francis King, one of the few fascinating and suggestive garden writers is going to let her compatriots have the benefit of her uncommon knowledge by adapting this tabulation to the needs and conditions of the United States. Henceforward there will be no excuse for a jumble of colours in the gardens of either this or that country.

JOHN FOTHERGILL

The Spreddeagle, Thame, Oxon

NOTE

1. Italics mean annuals. Where figures showing height are used without an inch sign, they mean feet.
2. The numbers after names refer to the seed-packets of Vaughan and Company, 10 West Randolph Street, Chicago, and 47 Barclay Street, New York.
3. The blooming period allowed for is only the normal one. "In so many ways" says Mr. Fothergill "plants and bulbs can be made to bloom early or late or continue long or give a second harvest."
4. By checking with pencil in the narrow columns against all the plants existing in the garden or in seed-trays, one will have, year by year, a colour-box of all the materials in one's possession with which to make arrangements.
